

# PLASMITE™ PEST DEFENSE SYSTEM®

## Tubes in the Wall™

A patented, state-of-the-art product and service designed to satisfy your need for **effective** and **convenient** pest control.

While the house is under construction, a network of small plastic tubing is installed in designated walls. These tubes are perforated every 12 inches and are linked to service ports on the exterior of your home.

Every 12 months, a professional pest control technician injects precise amounts of pest control materials from these ports into the tubes.

Service also includes an application of pest control materials around the outside of your home and an exterior treatment of windows, doors, eaves and weepholes.

# 5 Reasons to have the Patented Pest Defense System in your Home

*The Pest Defense System  
Tubes in the Wall  
offers these unique benefits and provides  
GUARANTEED results.*

## #1

Minimal exposure to family, pets and interior surfaces, because the pest control materials are applied directly into walls.

## #2

After the initial visit, you do not have to be home during service, since the ports are located on the outside walls of your house.

## #3

No need to move furniture, clear cabinets or clean countertops before service, plus no staining or cleanup afterwards.

## #4

Lasting treatments due to minimal exposure to ultraviolet light, which can reduce the effectiveness of pest control materials.

## #5

Comparable in costs to conventional pest control treatments.

Our professional pest control technicians are dedicated to quality customer service and your total satisfaction.

Ask us about our termite treatment and pest control services.

If you have questions and are ready to begin your Plasmite™ HomeTeam Pest Control service, please call us.
